Installing MySQL Workbench/WAMP/Community_Bank_Database.SQL

1. Install WAMP (for Windows), LAMP (for Linux), or MAMP (for Mac) (wampserver.com)

2. Download My SQL Workbench (8.0.23) (https://dev.mysql.com/downloads/workbench/)

    1. Be sure to save the Workbench download inside the WAMP/LAMP/MAMP folder, located in WAMP->bin->mysql.

3. Turn on WAMP/LAMP/MAMP by clicking the icon. Allow the app to make changes to your device. An icon will pop up in your taskbar— this icon will be green if all services are running correctly.

4. Go into MySQL Workbench, and it will prompt you to create a new connection. Name the new connection "test", and leave everything else as is. Workbench will automatically utilize the server if installed correctly.

5. Open Community_Bank_Database.SQL, and copy the code.

6. Paste it into your new query tab. Rename the new database if you would like. If you choose to rename, be sure to change the USE statement to reflect the new name.

7. Run the query (lightning bolt in the query tab).

8. Refresh the Schema—all tables, fields and records should be recorded.
